Multi-page static website using semantic HTML5

AIM:

To design and develop a creative and user-friendly multi-page static website using semantic HTML5 elements.

PROCEDURE:

1. Create the Project Folder

Create a folder named **Student_Learning_Portal** to store all HTML files and the CSS file. The folder contains five HTML pages: index.html, courses.html, register.html, resources.html, and contact.html. It also contains style.css for the website design.

2. Design the Home Page (index.html)

Use the header element for the website title and welcome message. Use nav to create links to all five pages. Use main, section, and headings to display the welcome message and learning highlights. Use CSS to add background colours, buttons, and a neat layout.

3. Design the Courses Page (courses.html)

Use header and nav for the common heading and navigation links. Use headings and sections to display the available courses, such as HTML, Python, and C++. Use cards and a table to show course names, duration, and level. Apply CSS to improve the appearance.

4. Design the Registration Page (register.html)

Use the form element to collect student information. Use label, input, select, textarea, and button elements to create the form. Include fields for name, email, phone number, course selection, and address. Use CSS to add spacing, borders, and a clean form design.

5. Design the Resources Page (resources.html)

Use header, nav, main, and section elements to organise the content. Use lists and links to provide useful learning websites, such as HTML tutorials, Python, and MDN Web Docs. Use CSS cards and buttons to make the page attractive.

6. Design the Contact Page (contact.html)

Use headings and sections to display contact information, including email and phone number. Create a simple message form using input, textarea, and button elements. Use CSS to maintain the same design as the other pages.

7. Implement Page Navigation and CSS Design

Add hyperlinks using the a element on every page so users can move between all five pages. Use a common CSS file named style.css to apply colours, spacing, borders, buttons, and card designs. Use a blue, white, and light background colour theme to make the website attractive and easy to read.

8. Test the Website

Open index.html in a web browser. Check that all five pages load correctly and that the navigation links work. Test the registration and contact forms. Check that the colours, buttons, tables, and other elements display properly.

CODING:

PAGE:1 (Home page)

```
<!DOCTYPE html>
<html>
<head>
   <title>Student Portal</title>
</head>
<body bgcolor="#EAF4FF">

<header>
   <h1 align="center">Student Learning Portal</h1>

</form>

<hr>

</body>
</html>
```

Result

Thus, a simple and attractive **five-page Student Learning Portal** was created using HTML5 and CSS. The website contains Home, Courses, Registration, Resources, and Contact pages with working navigation links and a consistent design.
